

GDC Plugin Manager

Complete User Guide

Version 1.19.3

English

User Guide — GDC Plugin Manager

1. What is GDC Plugin Manager

A FREE app for Mac and Windows — a single catalog for everything GDC offers: plugins and presets for DaVinci Resolve (automatic install), direct-download resources for Premiere/Final Cut/Resolve, courses, learning materials, events, partner stores and service centers, plus the other GDC apps. Every GDC product unlocks through a one-time donation, never a subscription.

2. Global search

The search bar at the top of the window searches ALL sections of the app at once (products, resources, courses, events, stores, services) — you don't need to know in advance where something lives. Type anything — a name, a type, a description — and results from every category appear below the search bar. The field also remembers your recent searches as quick suggestions.

3. Installing products for DaVinci Resolve

The DCTL / LUT / Fuse / PowerGrade / OFX sections in the sidebar contain plugins that install AUTOMATICALLY, straight into the folders DaVinci Resolve reads at launch. Press "Install" on any card — no folder hunting, no manual file copying. To update, press "Install" again — the new version overwrites the old one automatically.

4. Downloadable Resources (Premiere, Final Cut, Resolve)

The "DOWNLOADABLE RESOURCES" section in the sidebar (LUTs, Audio Effects/SFX, VFX/Overlays, Plugins, Audio) contains files you DOWNLOAD directly, with no automatic install — because they're meant to work in other editing apps too (Premiere, Final Cut), not just Resolve.

Note: after downloading a resource, the app offers a "Where did you save it?" button — pick the folder, and the app remembers the path so you can find the file quickly later with "Open folder".

5. Community & Education

Courses (booked directly via WhatsApp, with price options), Learning materials (recommended books/online courses/guides, with an external link), Events (workshops and festivals, with a map button if a physical address is set), Partner stores and Service & Repair (photo/video gear) — all in the sidebar, under the "COMMUNITY & EDUCATION" group.

6. My Apps

Automatically detects the other GDC apps already installed on this computer (DataMover, CursorPro GDC, GDC Vault, MediaFlow Monitor) and shows them with a quick-launch button plus an indicator if a newer version exists. You can also add your own shortcuts to any other app (e.g. DaVinci Resolve, Premiere) with "Add shortcut".

7. Partner Offers & Promotional Support

"Partner Offers" shows temporary promotions from third-party photo/video gear brands (not GDC products) — some include a coupon code. GDC's own products may temporarily carry a lower "Promotional support" amount than usual (e.g. for Black Friday) — it's still a donation, shown with the old amount struck through.

8. Bundles

Combinations of GDC products (plugins, resources, courses, audio) at a better total price than buying each item separately. The full list of included products is visible right on the bundle's card.

9. Purchase and activation

Pick a product from the catalog, click "Buy", then enter the received serial code in the License section. Each product is activated separately, once, on this computer.

10. PowerGrades

Automatically imported into Resolve's Gallery if the app is open. If not, follow the on-screen instructions.

11. Machine ID

Machine-locked codes use a unique hardware identifier, shown in the License section — send it when requesting activation of a product.

12. Theme and Text Size

From Preferences (⌘,) you can pick the app's theme — System, Light or Dark — independently of your macOS setting, and the text size — Small, Normal, Large or Extra large. Both apply instantly, no restart needed.

13. Automatic updates

The app checks automatically, at every launch, whether a newer version exists (you can also check manually from the menu: GDC Plugin Manager → Check for Updates...).

What happens when a new version exists:

- 1 A pop-up window appears with the version number and a short summary of what's new ("What's new").
- 2 The "Update now" button opens directly the download page for the new package — you need to download and install it over the current version (this is not a silent background update; the app cannot replace its own files while running).
- 3 The "Later" button closes the window — you'll be reminded again on a future version, not at every launch for the same already-dismissed version.

14. Dependency Panel (the red/green indicator)

At the top of the app window you'll see a small colored dot followed by a short label ("System ready" or "Needs attention"). It tells you whether everything DaVinci Resolve needs is present on this computer.

☐ Red dot — "Needs attention"

- 1 Means a REQUIRED component is missing (DaVinci Resolve itself, or — on Windows — the Visual C++ Redistributable). Without them, plugin installs have nowhere to write their files.

☐ Green dot — "System ready"

- 1 Means everything required is present — you can install any product from the catalog without issues.

Exactly what to do when you see the red dot:

- 1 Click the indicator at the top of the window. A new window opens, called "System Check & Dependencies".

- 2 In this window you'll see a list of components, each with its own colored dot. A missing component shows an "Install..." button next to it.
- 3 Press that button — it opens the official download page for the missing component (e.g. DaVinci Resolve, on the Blackmagic Design site). The app does NOT install anything automatically here — DaVinci Resolve is ~5 GB and requires accepting its own license agreement, so downloading and installing stays your step.
- 4 After installing the missing component, go back to the panel and press "Recheck all" — the dot should turn green.

Components marked "Optional" (LUT/DCTL/OFX/Fusion folders, or the Scripting API for PowerGrade) don't block anything — they appear automatically on the first install of that product type, or just make PowerGrade import automatic instead of manual.

15. Phone app (Android and iPhone)

Open gordas.dev on your phone — the full catalog (products, resources, courses, events, community) is available directly in the browser, no app-store install needed. From the browser menu, choose "Add to Home Screen" for an icon that behaves like a regular app.

16. Support

For any issue, use the contact button in the app (WhatsApp).
