

User Guide — GDC Plugin Manager

1. What is GDC Plugin Manager

A FREE app for installing, updating, and licensing GDC products (LUTs, DCTLs, PowerGrades, OFX and Fuse plugins) for DaVinci Resolve.

2. Purchase and activation

Pick a product from the catalog, click "Buy", then enter the received serial code in the License section.

3. Installing products

Click "Install" on any catalog card. The app copies the files directly into the correct DaVinci Resolve folders.

4. PowerGrades

Automatically imported into Resolve's Gallery if the app is open. If not, follow the on-screen instructions.

5. Machine ID

Machine-locked codes use a unique hardware identifier, shown in the License section.

6. Automatic updates

The app checks automatically, at every launch, whether a newer version exists (you can also check manually from the menu: GDC Plugin Manager → Check for Updates...).

What happens when a new version exists:

- 1 A pop-up window appears with the version number and a short summary of what's new ("What's new").
- 2 The "Update now" button opens directly the download page for the new package — you need to download and install it over the current version (this is not a silent background update; the app cannot replace its own files while running).
- 3 The "Later" button closes the window — you'll be reminded again on a future version, not at every launch for the same already-dismissed version.

7. Dependency Panel (the red/green indicator)

At the top of the app window you'll see a small colored dot followed by a short label ("System ready" or "Needs attention"). It tells you whether everything DaVinci Resolve needs is present on this computer.

☐ Red dot — "Needs attention"

- 1 Means a REQUIRED component is missing (DaVinci Resolve itself, or — on Windows — the Visual C++ Redistributable). Without them, plugin installs have nowhere to write their files.

☐ Green dot — "System ready"

- 1 Means everything required is present — you can install any product from the catalog without issues.

Exactly what to do when you see the red dot:

- 1 Click the indicator at the top of the window. A new window opens, called "System Check & Dependencies".

- 2 In this window you'll see a list of components, each with its own colored dot. A missing component shows an “Install...” button next to it.
- 3 Press that button — it opens the official download page for the missing component (e.g. DaVinci Resolve, on the Blackmagic Design site). The app does NOT install anything automatically here — DaVinci Resolve is ~5 GB and requires accepting its own license agreement, so downloading and installing stays your step.
- 4 After installing the missing component, go back to the panel and press “Recheck all” — the dot should turn green.

Components marked “Optional” (LUT/DCTL/OFX/Fusion folders, or the Scripting API for PowerGrade) don't block anything — they appear automatically on the first install of that product type, or just make PowerGrade import automatic instead of manual.

8. Support

For issues, use the contact button in the app.
